The secrets of 2017's hottest supercar revealed

KEEP IT SHINY,

KEEP DIRT, DUST, AND GRIME AWAY FROM YOUR RIDE WITH NANOREPEL

We all want our car to look like it just came out of the waxing booth at the car service, but it is not the easiest task in Sri Lanka's humid weather, where dust and dirt stick to the paint, mud cakes around the rims during the monsoons, and the birds have a way of delivering surprise gifts just when we take it out of

the wash. During the rainy season, this dust makes rain water stick to the windscreen and results in poor visibility. Now, Nanorepel, the intelligent surface coating is here to the rescue. True to its name, it repels dirt and rainwater as well as those unwanted splashes from birds. What is even better? It takes only a few minutes to protect your ride for several months.

LIKE BRAND NEW!

Level of effort:

Medium

Time spent:

20 to 30 minutes, depending on the size of your vehicle

What you need:

A sponge, a bucket of water, microfiber cloths, Nanorepel cleaners and coatings

What to check for: Make sure your car is thoroughly washed and dry. If it is a new car, we suggest you treat it with Nanorepel before anything else to preserve its good looks for many years.

Malik Fernando
Managing Director, CEO

Nanorepel can be used to protect rims, glass, car paint and the interior textile and leather. Follow these four easy steps:

01 Wash the body of your car clean of all grime and dust. Make sure it is thoroughly dry. Choose a bright, sunny day, so this won't take too much time. However, work in a shade if you want to economize on the amount of Nanorepel you need. With a soft cloth apply a thin layer of Nanorepel Uniclean on the body of the car and wipe away any other grime you have missed during the wash. Start with one section or panel to make sure you do not miss out any spots. Let it dry.

02 Similar to the body of the car, wash the rims or alloys of your car and let them to thoroughly dry.

03 Now it is time to protect the paint with Nanorepel High Performance Coating for Car Paint. Spray the coating on the body of the vehicle and evenly apply it in a thin layer with a soft cloth. Work with one section or panel to ensure you cover all the surfaces. Rub each panel in a circular motion.

04 Apply Nanorepel High Performance Coating for Rims on the rims and alloys of your tyres and evenly spread it using a soft cloth. Let it dry. As simple as that! Now your car is protected for a few months.

NANOREPEL™

Take it on a dusty road, or let birds leave their marks all over it. Your paint will be safe. All you need to do is to quickly hose it down, and your ride will look as good as new. Similarly you can coat your interior textile and leather and car glass to make them hydrophobic and oleophobic with a simple clean and protect approach.
